METHOD AND DEVICE
FOR DOWNLOADING SETTINGS FOR AN APPLICATION

Abstract

Settings for an application may be downloaded into a device, for example, to facilitate a request for subscription to a service. The device may be programmed in dependence of at least one predetermined application, such that the device is configured to display a menu in which a user may navigate, the menu being associated with said application and guiding the user. The device may be actuated by means of a keystroke while in said menu causing the device to contact a server and download the settings for the application. The device may contact the server over the air by calling a telephone number loaded into the device and associated with said application. A session may be established with the server, wherein questions and answers are presented in further menus in the device. Thus, the device may be prepared by providing customized application specific menus, which may be self-instructing and user friendly. The menus may guide a user to select the required keystrokes, the number of which may be relatively low.
